

With years of security ex

e largest Fortune 500 companies in the Uni

- **Penetration Testing.** The Tek has conducted external and internal penetration testing for some of the largest Fortune 500 and 1000 companies in the United States. Penetration Testing is a critical component of each and every company's security plan. Simple vulnerability scanning is a great start for a company, however a full penetration test and validate not only risks identified in the vulnerability scan, but it can also identify problems in your company's internal security policies such as password policies and document management / storage policies.

- **Internal Security Policy Review.** With our properly designed security policies your company is vulnerable to a wide range of attacks. How often does your company apply patches to critical server infrastructure? What is your internal password policy? How often are users required to change their passwords? Where are employees allowed to store confidential internal documentation? The Tek will help your company answer all of these questions and more, not only will we review your company's current internal security policy but assist in the creation of a new policy if needed.

- **Intrusion Detection.** Your company's network is under attack right now. Hackers all over the world are using automated tools to scan wide ranges of IP addresses including yours! By deploying an IDS system your company can detect threats and react to them long before an attacker ever penetrates your network. Ask The Tek today how an IDS can help protect your company's core infrastructure.

- **Computer Forensics** The Tek can assist your company with computer forensics. If a previous employee tried to delete critical company data, or you need to identify copyright infringement or software piracy, The Tek can help you out!
